## Summary

**Software Engineer** with around **4 years** designing and scaling **distributed systems** and **microservices at scale** using **Ruby on Rails** and **React.js**. Drove **80% latency reduction** on 50K+ daily transactions, eliminated \$180K/year in SLA penalties, and shipped **LLM-powered pipelines** that automated 40% of manual workflows. Experienced **full-stack engineer** with a proven record of owning features end-to-end — from **system design** and **API architecture** to **production observability** — in fast-moving **Agile** environments. Recognised for **cross-functional collaboration**, **stakeholder communication**, and **technical mentorship** that consistently raise the engineering bar across teams.

## Skills

**Languages:** Ruby, JavaScript (ES6+), SQL

**Frontend:** React.js, Redux, HTML5, CSS3, TailwindCSS, Performance Optimization, Component Architecture

**Backend & APIs:** Ruby on Rails, RESTful APIs, GraphQL, Sidekiq, Microservices, Distributed Systems, API Design, System Design

**Databases:** PostgreSQL, MongoDB, MySQL, Redis, Query Optimization, Indexing Strategies

**Cloud & DevOps:** AWS (EC2, S3, RDS, Lambda, CloudWatch), Docker, CI/CD, DataDog, Observability

**Tools & Practices:** Git, RSpec, Unit Testing, Agile/Scrum, Code Review, Technical Mentorship, Cross-Functional Collaboration, Stakeholder Communication

## Experience

**Software Engineer**, Mirafra Technologies | Bangalore, KA

**Sep 2025 – Present**

- Resolved **12+ critical production incidents** across the full stack before SLA breach, reducing system downtime by **30%** and saving **\$180K/year** in SLA penalties — highest incident-resolution rate on team.
- Re-architected bulk data pipelines using **Sidekiq distributed background jobs**, cutting synchronous request time by **80%** and eliminating timeout errors across **50K+ daily transactions**.
- Eliminated **N+1 query patterns** via targeted ActiveRecord optimizations and composite indexing, reducing API p95 latency by **40%** across 3 high-traffic endpoints serving production traffic.
- Designed and deployed **DataDog APM** and **AWS CloudWatch** dashboards with proactive alerting, cutting mean time to detect (MTTD) by **50%** and delivering end-to-end observability across the entire service layer.
- Led **cross-functional collaboration** with product and QA across **6 sprints** to triage and reprioritize incidents, cutting average resolution cycle time by **25%**; primary **stakeholder communication** point during high-severity outages.

**Software Engineer**, VIT Infotech | Bangalore, KA

**Jul 2022 – Aug 2025**

- Designed and shipped **15+ RESTful APIs** in Rails serving **10K+ monthly active users** at sub-200 ms average response time; authored API contracts adopted as team-wide design standards.
- Integrated **OpenAI GPT APIs** into an editorial content pipeline, automating **40%** of manual workflows and compressing content production cycle time **3x** (3 days → under 1 day).
- Drove **35% database performance improvement** through systematic query plan analysis, selective indexing, and eager loading — resolved the top 5 slow-query bottlenecks causing production degradation.
- Engineered **30+ reusable React.js components** adopted across 4 product modules, accelerating new feature UI delivery by **25%** and enforcing design-system consistency at scale.
- Instituted bi-weekly **technical mentorship** and structured **code review** sessions that reduced production bug escape rate by **20%** in 6 months; managed static asset delivery via **AWS S3** and CI/CD pipelines, raising the engineering bar across a 6-person team.

## Projects

**1. AI-Powered Content Management System** — Rails, MongoDB, React.js, OpenAI API

- Built a multi-tenant, **role-based CMS** on **MongoDB** supporting **20+ concurrent editors**; LLM-assisted drafting cut content generation time by **40%** and boosted publishing throughput by **30%**.
- Implemented a **REST API caching layer** using **Redis-backed ETags** that reduced average read latency by **45%** under peak editorial load without additional infrastructure cost.
- Designed a **webhook-driven event system** decoupling editorial actions from downstream services, enabling zero-downtime deploys and horizontal scalability.

**2. Health Management System** — Ruby on Rails, PostgreSQL

- Architected **HIPAA-aligned RESTful backend** backed by **PostgreSQL** with structured query logging; resolved **8 critical slow queries**, slashing average page load from **3+ seconds to under 500 ms**.
- Enforced **role-based access control (RBAC)** and JWT-based authentication across all API endpoints, hardening data security for patient records without impacting response time.

**3. Crowdfunding Platform** — React.js, JavaScript

- Shipped a **React campaign analytics dashboard** with code-split lazy loading and memoized selectors, cutting initial render time by **35%** and scoring **92/100 on Lighthouse**.
- Implemented **real-time contribution tracking** via **WebSocket** integration, enabling live pledge updates without full-page reloads for active campaigns.

## Education & Certifications

**B.Tech in Computer Science** — SRIT

**Aug 2018 – Jun 2022** CGPA: 7.8 / 10

**Meta Back-End Developer Professional Certificate** — Coursera

**2023**

**AWS Certified Developer – Associate**

*Expected: Aug 2026*
